Abstract

The increase of electric vehicle (EV) use as a reliable and eco-friendly means of transportation has increased rapidly over the past few years. When choosing an EV, the vehicle's performance is a decisive factor to be taken into account. An EV's driving range prediction depends on multiple factors that must be factored in to accurately infer results. As machine learning has become a widely used approach for finding sub-optimal solutions on complex mathematical problems, EV's driving range prediction through machine learning could become an accurate enough solution for any vehicle. Previous work has covered a history-based method on an adaptive model for EV's driving range prediction. The present project explores the implementation of a machine learning based model to learn from existing data, adapting with changes and aiming to provide more real and accurate results.

Keywords: electric vehicle; range prediction; energy consumption; machine learning

Introduction

Electric vehicles are the future

On today's day and age, the global concern on climate change has been a major focus on recent international agreements, such as the Paris Agreement [3], incentivating many car manufacturers to introduce Electric Vehicles (EVs) as the eco-friendly solution for sustainable transport for the future.

As EVs have been increasing in popularity in recent years, car manufacturers have increased competitiveness on vehicle's performance, a decisive factor for consumers [2].

A vehicle's autonomy also known as eRange, can be estimated through many driving data parameters, such as vehicle design, driver's behavior, weather, road inclination and gSOC estimation. The eRange accuracy allows consumers to rely on its vehicle for longer travel time and efficient charging plans. eRange estimation however, is a complex problem which has prompted previous studies in the past to provide a solution [1, 4].

Prior work [1] on eRange estimation demonstrated that using an history-based algorithm on an adaptive model provides a more reliable eRange prediction than a basic state of charge (SOC) - manufacturer data relation, this is mainly due to taking into account the vehicle's driving history.

TODO: Mencionar IA na atualidade

This project approaches the eRange estimation problem with the use of machine learning based model to increase its accuracy.
